

America Needs an Energy Bill That Takes Us Forward on Global Warming

THE SENATE SHOULD:

- **SUPPORT** the Bingaman Renewable Electricity Standard of at least 15% by 2020
- **SUPPORT** a Renewable Fuels Standard that includes essential environmental and economic safeguards
- **SUPPORT** the Schumer Energy Efficiency Resource Standard Amendment and other energy efficiency measures
- **OPPOSE** amendments by Sen. Levin and others that would seriously undermine the CAFE compromise
- **OPPOSE** liquid coal—a dirty and expensive boondoggle that takes us backward on global warming

Americans, including our millions of members, urgently want Congress to take us in a new, forward-looking direction on energy and global warming. The Senate now has the opportunity to begin delivering for the American people by adopting new energy policies that make a down payment in the fight against global warming, boost renewable energy production, increase energy efficiency, and make a meaningful increase in fuel economy standards for cars and trucks. Instead of business as usual, it's time for the Senate to do the people's business and pass a strong bill that truly achieves these goals without further compromise or delay.
