**UNITED STATES OF AMERICA**
**BEFORE THE**
**FEDERAL ENERGY REGULATORY COMMISSION**

| | | |
|---|---|---|
| Interconnection of Large Loads to the Interstate Transmission System | ) ) | Docket No. RM26-4-000 |

**Supplemental Comments of the Sierra Club**

Pursuant to the Federal Energy Regulatory Commission's ("Commission") October 27, 2025 Notice Inviting Comments[1] on the Department of Energy's advanced notice of proposed rulemaking ("ANOPR")[2] addressing interconnection of large loads to the interstate transmission system, the Sierra Club respectfully submits these supplemental comments. As it explained in its initial comments, Sierra Club agrees that changes are necessary to incorporate new large loads into the transmission system without raising costs and jeopardizing reliability for the hundreds of millions of Americans who rely on the grid.[3]

As detailed in Sierra Club's previous comments, the rapid proliferation of data centers has already caused significant harms to existing ratepayers across the country. Ratepayers in PJM, however, have seen an outsized impact. To underscore the need for reforms, 3,844 Sierra Club members residing in the PJM footprint signed letters urging the Commission to take action that will ensure that costs caused by data center owners are not placed onto Sierra Club members and other existing ratepayers.[4] Additionally, the Sierra Club chapter directors for all 13 PJM states and Washington DC signed a letter urging the Commission to act.[5] These letters provide

[1] *Notice Inviting Comments*, Docket No. RM26-4-000 (Oct. 27, 2025).
[2] Secretary of Energy, *Ensuring the Timely and Orderly Interconnection of Large Loads*, Advanced Notice of Proposed Rulemaking (Oct. 23, 2025).
[3] *Comments of Public Interest Organizations*, Docket No. RM26-4-000 (Nov. 21, 2025).
[4] Attached as Appendix B.
[5] Attached as Appendix A.

four principles that Sierra Club members and chapter directors believe the Commission should use to guide its decision:

1. The costs to power data centers should be paid for by data center owners, not residential ratepayers.

2. FERC should encourage policies to ensure that the lowest-cost energy technologies, including abundant, clean energy like solar, wind, battery power, and geothermal come online to match rising electric demand and ensure grid reliability.

3. State efforts to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

4. Electric system design should prioritize all consumers, especially small residential consumers typically underrepresented in decision-making.

It is not often that thousands of everyday people take the time to make their voices heard by the Commission on a complex proceeding like this one. We urge the Commission to consider and act on the principles outlined by the 3,812 Sierra Club members and 14 chapter directors as it prepares to act on the ANOPR next month.

May 20, 2026

Respectfully Submitted,

# APPENDIX A

SIERRA CLUB

14 May 2026

Federal Energy Regulatory Commission
888 First St NE,
Washington, DC 20426

*Attention: Chair Swett, Commissioner Chang, Commissioner See, Commissioner Rosner, and Commissioner LaCerte*

Dear FERC Commissioners,

We, Directors of the 14 Sierra Club Chapters representing the 13 PJM states and the District of Columbia, are committed to ensuring that the region's energy future is reliable, affordable, and aligned with the health and economic well-being of the communities we serve. Together, our 14 Chapters represent 152,193 dues-paying Sierra Club members within PJM.

We write to you now, almost halfway through a year of change and big questions. Who will pay for the costs imposed across the system by new large loads? How will the connection of these large loads to the grid affect states' abilities to meet their climate and clean energy goals? As you collectively pen your response to the multiple RTO large load policy proposals, as well as the pending Notice of Public Rulemaking regarding Large Loads, we write to elevate the concerns that 3,972 of our members have shared directly with us.

The Sierra Club has been actively engaged throughout the PJM stakeholder process in the development of a regional large load interconnection policy through the Critical Issue Fast Pass (CIFP) for Large Load Additions and now via subsequent stakeholder processes (including the Backstop Reliability Auction). Yet the gravity of your Public Rulemaking will have broad-reaching impacts beyond PJM's borders.

In Spring 2026, we reached out to our members, many of whom are experiencing the everyday burden of increasing electricity bills and are worried about the future of our planet under a world of continued fossil extraction that exacerbates the impact of global climate change. These members are frustrated that they are being forced to pay the financial and reliability costs that hyperscalar data centers and a handful of technology elitists are imposing on a system that is not currently equipped to meet this moment of unprecedented growth.  We asked them to share their thoughts with you; almost 4,000 people wrote from across PJM and beyond. These comments are attached for your review. A number of key principles are woven throughout.

Chiefly, as FERC considers how to address large load additions (LLA) like data centers, your decision should be guided by four principles:

- The costs– financial as well as health and other community costs–to power data centers should be paid for by technology companies and developers, not residential ratepayers.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- Electric system design should not give preference to larger industrial users, such as data centers, at the expense of residential and other consumers, including small consumers, and particularly residential ratepayers, who are typically underrepresented in decision-making processes.

We need you to make it clear that our power system—which was paid for by everyday people across American communities paying their utility bills—serves those customers, **not** billionaires who own technology companies.

# APPENDIX B

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Will Burke

Eagle River, AK 99577

Companies get tax breaks. They should be using their tax breaks to pay for the things that definitely should not be underwritten by the public.

I DO NOT want to pay for the electricity used by data centers. I want NOTHING to do do with data centers. We dont need them. Wast of money and land. Again, i DO NOT my fellow neighbors or myslef to help pay for this.

I dont want our already fragile power grid to suffer either. These stupid data centers dont even that many jobs for the amount of resources they take up.

Also AI sucks.

Have a good day. God bless.

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Nyssana Reyes

Peoria, AZ 85345

Now is not the time to comprimise our environment!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Caroline Lacy

Phoenix, AZ 85028

Apache Junction, AZ 85120

Citizens shouldn't have to foot the bill for tech companies, especially when these companies invade our living spaces with ugly compounds using valuable (and in most cases scarce) resources. We pay taxes and they get tax breaks. We converse and try to protect nature. They come in and get a free ride, make money, and ruin resources while undermining clean energy policies. Make them pay and make them follow the law.

Sincerely,

Ejay M

Payson, AZ 85541

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Joan Bundy

WATER, WATER, WATER, WATER, WATER, WATER, WATER!!! WATER IS LIFE, and only a bunch of dummies could EVER think that Data Centers are an acceptable Industry in a WATER STARVED STATE LIKE ARIZONA!!! Not to mention the enormous electrical strain that is ALREADY being "proactively" billed to Arizona Residents!!! Bloody Stupid, but then look who is supporting them and PROFITING off of them!!!

Working families are tired of carrying the brunt of energy costs for big corporation and billionaires. My tax money should not be giving tax breaks, nor waiving their fiscal responsibility to our community. While our communities' energy costs are going through the roof, they are also polluting our air, taking a lion-share of water, and taking large swaths of property for machines and not people. It's time to be responsible and pony up their own funds and to be stewards of our air, water and electricity.

Think of the future of the planet.  Please design policies that protect the environment and secure our water supply.  We don't need data centers.

Yours very truly,

Emlyn Lydford

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Emlyn Lydford

Mesa, AZ 85205

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Jimmie Lunsford

San Diego, CA 92116

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Evan Elias

San Francisco, CA 94109

I fully endorse this message. AI itself is an unknown quantity in terms of its consequences over time, and the data centers are the a clear early result of its problems.

To the Federal Energy Regulatory Commission (FERC):

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Bonnie Werner

Riverside, CA 92507

This is just nuts.  AI has a place, but not at the expense of everything else.

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Richard Grubbs

Ranch Mission Viejo, CA 92694

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Alena Jorgensen

Temple City, CA 91780

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Michael Roitman

Santa Monica, CA 90405

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Frederic Cannon

Orange, CA 92868

Thank You!

As the future rapidly unfolds and we go down the AI path so quickly with unknown final consequences, we can predict that the energy and water use associated with big tech is threatening to out a strain on everyday families and people just trying to live. Please

Work to make certain that this dystopian future does not come anywhere close to true, but that we make sure energy consumers get the cheaper rates they bargained for in all of our work to have a clean energy future for everyday living. Make Big Tech pay for it- but it?s hard to pinpoint who is accountable right, when it comes to AI? Please sniff out the sources and hold them all accountable for the tab. Thank you for working to protect the people from the corporate powers. Please don?t let this power abuse us.

Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Lindsey Slocum

Lafayette, CO 80026

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Laura Page

Louisville, CO 80027

Data centers and other large commercial projects should not only bear the ENTIRE cost of utility upgrades needed due to their demands, but they should also contribute to a "future fund" which would cover future costs that are as of yet, unknown! DON'T BREAK THE BACKS OF MILLIONS OF HARDWORKING AMERICANS for MORE Corporate profit!!!!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Doug Miller

Lyons, CO 80540

Data centers should be responsible for their own power so as to protect residential customers from increases in energy bills. They also should be strongly encouraged to use clean energy. Especially in drought-prone states, they should be limited in the amount of water they use, preferably recycling water they use.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

Neva Blubaugh

Denver, CO 80211

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Bill Kellow

Fort Collins, CO 80521

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Julia Bototm

Longmont, CO 80503

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

David Rogers

Boulder, CO 80304

We do not need data centers to push AI to fund the mistake of different Billionaires investments.

To the Federal Energy Regulatory Commission (FERC):

Megan & Nick Wilder

Boulder, CO 80302

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Patricia Gustavson

Colorado Springs, CO 80908

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Leslie Singer Lomas

Boulder, CO 80303

It is wrong to harm the people who will suffer the consequences of the large data centers. Let's do the right thing and say NO!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Christie Randolph

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Andrew Ward

Lakewood, CO 80228

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

Henderson, CO 80640

This is obscene! Most citizens have to pay taxes, unlike billionaires, who are subsidized by the American government. I am a retired person and I cannot afford to subsidize billionaires. Additionally, the enormous amount of electricity, water, and land that will be used for these centers is not in the public's best interest. We all took notice of the billionaires who attending and paid $1M to attend Trump's inauguration, the very people who will be profiting from these centers and who do not want to lose any of their billions. We are fighting back! Get out of our states!!

Fort Collins, CO 80524

There's no way that these data centers should be allowed to co-opt local land, water and energy sources at the expense of local populations. If they are allowed to come into a community at all (and I don't think they should be), they should not only pay their own way, but also pay the community a premium for being allowed to be there. Local communities generally can't handle the infrastructure needed to accommodate these data centers any more than they can handle the horrific detention centers planned by DHS. Enough is enough!!!

To the Federal Energy Regulatory Commission (FERC):

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Danielle Schultz

Sanford, CO 81151

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

The AI data centers promise great technological solutions to many of life's daily activities but so far they are unsucessful in providing reliable information about things as simple as driving directions. The environmental consequences such as tremendous electrical consumption, water pollution and increased heat are not worth the overinflated claims about how much AI will help us in the future. AI is the modern day snake oil.

To the Federal Energy Regulatory Commission (FERC):

Sincerely,

Thomas Mariconda

Shelton, CT 06484

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Harvey Simon

Washington, DC 20011

The constituents of politicians who are grappling with enormous utility bills to fund the infrastructure for AI are utterly furious that they are paying the costs of an industry that- if it functions at all- will fiscally benefit a very few contingent of ultra rich people.

Washington, DC 20010

No need for all this greed, if they are billionaires they can clearly afford it. The everyday users have enough to contend with, the rising costs of everyday living and now you the consumers to pay for the data centers by raising electric bills? This formula is not sustainable so Big Tech has the money to create, Big Tech should have the money to sustain. These data centers have enormous needs so polluting the area by using the water and filling the atmosphere with elements that may cause harm to humanity is the answer? Where is the R&D on alternatives?

Larry Martin

Washington, DC 20016

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Darrick Wilson

WASHINGTON DC, DC 20003

Sincerely,

Ned Preston

Washington, DC 20007

This is huge: we can?t let the big money of Big Tech overwhelm our power grids. It makes the average US citizen vulnerable economically, and it compromises our infrastructure and its capabilities. BigTech - with all their billions in profit and all their creative resources - need to come up with a plan to pay their fair share. Better for the country, better for the environment in this fraught time of climate change, better for our future.

To the Federal Energy Regulatory Commission (FERC):

Hockessin, DE 19707

My neighbors and I are already feeling the pain of ridiculously large utility bills. People are struggling. Discussions on neighborhood sites mention things like using candles, flashlights and even burning wood furniture to stay warm. It's borderline insulting to get an email from the power company telling people to turn down the heat. Don't you think we've done that already? Don't you think we've layered up our clothing and opened curtains to have the sun (when it's out) warm our homes? I suggest taking a cold, hard look at what everyday people are facing. We can't take much more. Higher taxes, higher utilities, increasing costs for groceries... everything is overwhelming. Please help.

Tara Greatorex

Newark, DE 19702

As a grandmother and a person soon to be on a fixed income, I am very concerned about rising electricity bills. Much like the mortgage crisis of 2008, bankers ran ripshod over homebuyers, making money while homeowners lost their homes, all for lack of protections against big business taking advantage of consumers. The developers and builders of the Mega Data Centers should feel obligated to build them safely and correctly, but sadly will not choose to do so without the necessary guardrails provided by local government, with the support of its constituents.

Please support protections for Delaware ratepayers.

To the Federal Energy Regulatory Commission (FERC):

Wilmington, DE 19809

The current electric rate is exorbitantly high. In order to afford today's electric charges, we have to forgo some other daily necessities such as food and personal hygiene products. Increasing an already unaffordable rate will render the disabled, deprived and impoverished who are currently on fixed incomes without the ability to refrigerate food, maintain medically necessary devices that require electricity, to cook daily meals, the usage of water because most water pumps and water heaters are powered by electricity, and etc. Electric consumers should not be held accountable for large load additions....such an extraordinary will be exceedingly expensive and financially devastating to the average consumer.

To the Federal Energy Regulatory Commission (FERC):

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

James Maloney

Wilmington, DE 19805

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Ann Marie Banack

Wilmington, DE 19804

We?re already at risk for flooding and other environment climate consequences. Such large impervious structures increase our risk of flooding. At the same time, my energy bills are steadily increasing, you e compromised our access to off-shore wind energy sources and these data centers use excess energy, driving up prices while taking needed energy for existing uses.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Sandra O'TANYI

Magnolia, DE 19962

I am part of a two income family with four children. Each month we are pressed with tighter bills from mortgage payments, car payments, health payments, and not to mention the ever growing grocery bills. Having to worry about increasing electricity bills is further stressing and straining our already tightly strapped family. Please ensure data centers and NOT residents cover the costs of their massive energy demands so families like mine aren?t pushed further to the brink.

To the Federal Energy Regulatory Commission (FERC):

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Cj Bartell

Melbourne, FL 32940

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Michael Palmieri

Boca Raton, FL 33428

To the Federal Energy Regulatory Commission (FERC):

Dunwoody, GA 30338

We have a well organized energy system right now. It produces sufficient energy for families and businesses at current rates of usage. Do not destroy that system with your extremely high energy needs. Those entities that need such high levels must produce it! They cannot expect private citizens to subsidize their energy costs! We will protest such a move.

Nate Chun

Koloa, HI 96756

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Peter Scharf

Data Centers are certain to be HUGE consumers of both electricity and clean water. We, the people, should not pay more or subsidize the construction, maintenance and powering of Data Centers for billion dollar corporations. If the Data Centers are not profitable for the companies that install and own them, the cost of running them should not fall on everyday Americans - the cost should land solely at the feet of the billionaires building them. In addition, every day Americans should not have to deal with possible electrical blackouts, additional pollution from dirty power used to run the centers, or loss of clean water to cool the Data Center systems. Thank you!

To the Federal Energy Regulatory Commission (FERC):

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Sue Bradley

Lockport, IL 60441

Data centers should be required to pay for their own power needs.  Bid tech should not take priority over residential customers. And clean power must be the priority.  FERC and PJM must ensure all customers are fairly served!!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Jeffrey Mengler

St Charles, IL 60174

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Dekalb, IL 60115

Data Centers are building up at SUPER SPEEDS AND WITH ZERO OVERSIGHT AND AN EVALUATION OF THEIR IMPACT ON STRESSED LOADS & GRIDS, EFFECT ON HOMEOWNER AND SMALL BUSINESS CONSUMERS, AND THE IMPACT ON GREENHOUSE GASES AND CLEAN WATER USE.

ALL OF THIS MUST BE EVALUATED THOROUGHLY AND STRICTLY REGULATED. I DON?T CARE HOW WALL STREET WILL REACT & I DO HAVE TECH STOCKS!!!

THIS IS ESSENTIAL.

To the Federal Energy Regulatory Commission (FERC):

Sincerely,

Maggie Hennessy

Chicago, IL 60647

LLMs are currently underegulated and potentially very harmful (copyright infringement, AI psychosis, high potential for misuse through jailbreaking, and security vulnerabilities through prompt injection). I would like if we did something about that, but if we can't make Big Tech pay for the indirect costs of their products, we should at the very least make them pay for the direct costs of the electricity they require. I don't want to foot the electricity bill for training LLMs that seem to me to be a net negative to society.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Lawrence Todryk

Grayslake, IL 60030

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

I?m from Europe and I believe that the consumer protection agencies there would NEVER allow what US Americans in rural areas go through: contamination of air and water, increased cancer risks even for young people and children, higher risk of asthma and all sorts of other devastating effects from corporate polluters. And the polluters are never held accountable, even tho these corporations have the funds the make things right. And now on top of it, you want individual households to bear the burden of these data giants. I really do believe that American politicians no longer serve the people (not in all states, but some) at all anymore. Corporations are not people!!! Thank you listening and reconsidering. Your actions now affect the next seven generations!

Markham, IL 60428

These data centers are ridiculous and unnecessary. AI is being pushed on consumers to increase dependency on their products without caring how it will affect future generations. I will never support these data centers. If you insist on creating them despite voters? negative response then the tech companies should bear the full brunt of energy cost and providing their own energy for them. No consumer should have to pay their costs for something we will never have a genuine use for.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Michelle Lord Michelle Lord

Chicago Ridge, IL 60415

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

Americans are struggling enough with rising costs!  Add the punishing weather we're dealing with!  Too hot, too cold, rains, flooding, winds and tornadoes.... lightning and property damage.  Rising home and vehicle insurance fees.  That's already enough stress and difficulties, especially for senior citizens.  It isn't fair!

To the Federal Energy Regulatory Commission (FERC):

Our home and local utility are actually served by MISO, but my wife and I are hoping that  hoping you, PJM, will include appropriate Demand Response, Interruptible Services, and/or Backup Generation Requirements as you consider procedures for adding abnormally large loads to you system. We know your job is hard enough to optimize reliable and affordable electricity throughout  your region without having to consider local utility cost impacts, but we are kind of counting on you to do so. Thanks, Jerrold and Patricia Ulrey

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Jerrold Ulrey

Bloomington, IN 47401

Start supporting the people not the businesses

To the Federal Energy Regulatory Commission (FERC):

Elkhart, IN 46514

AI is a very useful tool but like all tools, they can be used for bad as well as good. Correct laws are necessary for this to be done well and not abused. Besides, it is expensive to develop this tool. Payment for the power, water, etc. needs to be paid for by the company not by the people, mostly farmers, who live nearby to pay for this development.

Peace,

Tom Nowak

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

George Wells

Lafayette, IN 47901

It is time for good leadership that cares about all people and the impact financially, health wise and socially - on all.  Are you up for this kind of leadership?

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Barbara Sheehan

Hammond, IN 46324

I don't think it is smart of Indiana's leaders to give it all away to industry and technology, but that is what seems to be happening. Make these big tech companies walk in the door ready to negotiate how they will pay for resources like water and energy that they consume from our state. They will affect the grid and my resources and my pocket book. That is unacceptable. Protect Hoosiers and our resources. Stop making people pay for the gains industry and fossil fuel companies enjoy.

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Judith Nelsen

Fort Wayne, IN 46804

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Ray Barry

Lexington, KY 40513

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

James Rentschler

Louisville, KY 40216

KEEP THESE MONSTERS OUT OF OUR STATE!  WE DONT NEED THEM!

To the Federal Energy Regulatory Commission (FERC):

Wallace McMullen

Louisville, KY 40216

I understand that AI companies are buying up water rights to keep data center machines "cool." Clean water is a precious resource that needs to be allocated to human beings and agriculture before systems designed to control and make us stupid by not exercising our minds the way they were designed. I am not concerned about climate change but I am concerned about misuses of technology and the electromagnetic frequency radiation they emit.

To the Federal Energy Regulatory Commission (FERC):

Utility ratepayers should not be subsidizing the energy costs of data centers for technology companies. These energy costs are business costs and should be paid by the businesses that use them. Do not compound the economic duress that American consumers are already under from utility costs by passing the energy demands of technology companies onto the consumer.

To the Federal Energy Regulatory Commission (FERC):

Shelly Skeens

Lexington, KY 40507

Big Tech should pay for their data centers and utility bills, not working class Americans. The builders should also be transparent about how much energy they will  need, and how this WILL NOT raise utility bills for regular folks. Also, how will the data centers affect the environement? We need to protect our air, land, and water from pollution, including noise. We do not want to pay for billionaire pipe dreams--especially not ones that may cause more harm than good.

To the Federal Energy Regulatory Commission (FERC):

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Janice Morgan

Murray, KY 44131

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

Karen Mauermann

Lebanon Junction, KY 40150

The costs to power data centers should be paid by the tech companies and developers, NOT residential ratepayers. AND Clean energy options like solar, wind, battery power and geothermal need to be encouraged rather than fossil fuel sources that would lock us in to more pollution , higher cost electricity. The decisions made around this topic will set the stage for years to come. So it?s imperative that FERC do the right thing to protect the residential ratepayers from being exploited by the data centers.

To the Federal Energy Regulatory Commission (FERC):

Lexington, KY 40503

This is our community and it deserves clean air, clean water, and respect. I do not want data centers consuming our water? rapidly contributing to the world?s increasing water crisis?while also polluting our communities and increasing our electric bills. These data centers are unwanted, unnecessary, and inhumane. Prioritize people, not profit. Advocate for safe and clean living conditions, not irresponsible technology with no safe guards. For once put human lives above bottomless greed. Our lives are on your conscience.

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Suzanne Nutt

lexington, KY 40517

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Catalina Rivera

Georgetown, KY 40324

Don?t add to our utility bills!

Steve Groze

Youngsville, LA 70592

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Kirsten Prufer

Baton Rouge, LA 70810

Pamela Meroski

Tewksbury, MA 01876

There are many people and groups who are in need of money from the government. Large tech companies aren't one of them. Especially with artificial intelligence, the industry is booming, with the leaders at these companies being among the richest in the world. This is clearly not where money needs to be sent. Additionally, this financial burden should not fall on tax payers. My town is already pushing for a massive override to raise taxes, largely for our school system. The last thing we need right now is to pay for projects that will fill the pockets of billionaires. The energy grid should not be built to serve datacenters and the companies that run them. Organizing power requires careful planning and consideration for all those involved.

To the Federal Energy Regulatory Commission (FERC):

Planet

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Frances Barber

Silver Spring, MD 20902

My family should be forced to subsidize the power bills the richest and most powerful companies in the world. Enough is enough!

To the Federal Energy Regulatory Commission (FERC):

Silver Spring, MD 20905

I live in Baltimore, MD. My electric BGE Bill is going up about 1 cent/month for the next 6 months = the bill only shows 6 months of expected energy costs. For 40 years now, I've tracked my electricity costs often - in 3 different states AND NEWS FLASH - this is the first time my bill has gone up monthly = usually the bill raises about a penny /Kwh every six months. WHY ARE YOU ASKING ME TO SUBSIDIZE THE DATA CENTERS???? => Make the Data Centers pay for the INCREASED COST of ELECTRICITY!!!!!! <= The owner(s) of the Data Centers are expecting to make a profit all the while charging me more money for electricity to support them. THIS IS CORPORATE WELFARE IN A TIME WHEN ACTUAL WELFARE SAFETY NETS HAVE BEEN DESTROYED.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Louise Harmony

Baltimore, MD 21214

I and everyone in the town I live has had a huge jump in our electric bills already. I can't keep the lights on in my home if there is another. The AI tech chambers should be paying for their own power, including the updates that must be made to the circuitry in order to supply them. They should all have solar panels on the tops of their buildings. They should supply their own batteries and backups. It should not be the burden of the populace to supply the rich with more money.

To the Federal Energy Regulatory Commission (FERC):

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Kristen Brown

Baltimore, MD 21239

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Paul Eisenberg

Baltimore, MD 21210

PLEASE, PLEASE demand that these companies provide their own sources of new and renewable power. Our electric bills are becoming untenable, and there is a danger of rolling blackouts impacting all of us, starting with the poorest.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Sincerely,

David Blockstein

Takoma Park, MD 20912

Once built, data centers add few good-paying jobs. If they also pollute, drive up energy costs, and destabilize the grid, why would anyone in their right mind allow them to be built? What we need from FERC are policies that ensure that data centers do not have these adverse consequences. For one thing, they must contribute to their own energy needs with a focus on the use of renewables and batteries. Do not allow them to become bad neighbors. Development is fine if it is responsible. Make sure it is.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. James R Monroe

Churchton, MD 20733

I'm so tired of hearing about billionaires getting wealthier every day at the expense of ordinary citizens. Let them take home a bit less for themselves and start paying their own way if they want to keep growing. Utility rates are rising quickly and clean energy goals being sidelined, all to meet the power needs of data centers we might not even need in 10-20 years. Require Big Tech to fund and provide their own energy sources!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. We must work together for our future?..no singular interest rules?.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

K Del Giudice

Frederick, MD 21703

To the Federal Energy Regulatory Commission (FERC):

Waldorf, MD 20602

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Tamara Stickler

Bel Air, MD 21014

To the Federal Energy Regulatory Commission (FERC):

Sharon Nelson

Pasadena, MD 21122

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Ron Verdonk

Clinton, MD 20735

To the Federal Energy Regulatory Commission (FERC):

Diane McDonnell

Silver Spring, MD 20906

Data centers should be responsible for producing their own energy and recycling the water that they use for cooling- at a normal temperature  and suitable for potable use. Big tech makes the money, they should be responsible for their own necrssities- such as water and electricity or another form of power that they arrange and pay for!

To the Federal Energy Regulatory Commission (FERC):

Sincerely,

Donna Bassin

Hagerstown, MD 21740

AI Businesses should take responsibility for their costs, especially the power required for operation of an AI Center.Build your own power source, preferably using solar, wind, geothermal and other renewable energy. PJM and FERC need to strongly remind businesses that residents and small businesses have the right to moderately priced electric power. States have the right to determne and enforce environmental laws which protect clean air,

water, limit light and noise levels. A little off subject, but a huge concern about AI Centers.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Pontiac, MI 48340

Some areas of Michigan already struggle with power, and Michigan is famous for it's water sources and they need to be cared for and protected. AI is pushing as fast as they can to make a buck. Put a brake on the process till ALL states can get a handle on what the cost will be in consumption and not put that cost on people. Also the amount of land being parceled out to these systems is reducing farm land and putting them too close to where populations are living.

To the Federal Energy Regulatory Commission (FERC):

Sincerely,

Emily Bovee

Berkley, MI 48072

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Lois Keel

Clarkston, MI 48346

To the Federal Energy Regulatory Commission (FERC):

Waterford, MI 48328

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Anthony Madonna

Clinton Township, MI 48036

I?m a college student and I, as well as many of my fellow college students, are very apprehensive about the future of AI and certainly what these data centers will mean for our communities.

To the Federal Energy Regulatory Commission (FERC):

Hailey Warnke

Hastings, MI 49058

No average person likes A.I.. In fact, most people I know despise it due to it's unreasonably excessive demands in terms of it's share of power and resources. Even though there are very few people who actually run Big Tech, they currently seem to have the majority of the say when it comes to the regulations and rules they have to follow. PLEASE PUT THE PEOPLE'S AND PLANET'S LONG TERM WELL-BEING OVER SHORT TERM PROFITS AND DON'T FORCE US TO BE PART OF THE PROBLEM BY FUNDING BIG TECH'S GLUTTONY.

To the Federal Energy Regulatory Commission (FERC):

I am very involved with student perceptions of AI, and I can tell you that students are scared and unsure! Trust me I literally did the research. It's our future and we do not want our energy and water dominated by large corporations who want to develop local areas without investing in the community. I would love to answer any of your questions about my research and perspective, and connect you to the campus organizations who have a steak, feel free to contact me @ 307 699 2961 or reesecol@msu.edu

Brighton, MI 48116

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Mark Kennedy

Ann Arbor, MI 48105

To the Federal Energy Regulatory Commission (FERC):

East Lansing, MI 48823

The improvements that might come along with an AI data center, and the subsidization of the resources they require is a logical conclusion in order to increase the profitability of the region and increase GDP. However, the long term ecological, social, and economic toll that these developments take are not worth their development in my opinion, and the subsidization of these projects is inane.

To the Federal Energy Regulatory Commission (FERC):

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Vickie Laskey

Newport, MI 48166

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

Jefferson City, MO 65109

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Tammi Hale

St. Joseph, MO 64501

To the Federal Energy Regulatory Commission (FERC):

Big Tech is ruining our planet. It's using valuable natural resources and mining. The aftermath is polluted water, higher rates of cancer. We need to look at the environmental impact of our actions. We need the earth, the earth does not need us. Our children and grandchildren deserve clean air and safe drinking water, affordable living.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Marjorie Geer

Kernersville, NC 27284

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

North Caldwell, NJ 07006

Our electricity bill has gone up too much already. Plus, with more and more storms occurring as the result of global warming, I really worry about the stability of the grid. If it fails, will regular small consumers be able to have working electricity quickly, or will we have to take a back seat to data center needs? And how can this all be sustainable? We cannot solve this problem without rules and without clean, sustainable green power!

Morristown, NJ 07960

Enough is enough..if they want to build their data centers, let them build the infrastructure they need and stop putting the burden on us while they profit and we pay!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Cathy Valendo

Monroe Twp, NJ 08831

To the Federal Energy Regulatory Commission (FERC):

West Orange, NJ 07052

Data centers place undue and unprecedented strain on our electrical grids, water resources, and land management practices. It's despicable to allow the buildout of power hungry, water guzzling, land snatching data centers for the profit of billionaires during a cost of living crisis and terrifying era of global water bankruptcy. The least that FERC and PJM can do is protect families from footing the bill for Big Tech's senseless energy demands.

To the Federal Energy Regulatory Commission (FERC):

AI centers are posing dire threats to our natural resources (especially water) , damaging our environment, eating up precious land, and hiking utility prices in a deeply illegitimate way for citizens - who should NOT be paying for the cost of operating these data centers.  In addition, they are serving an industry that is largely unregulated and poses serious threats to humanity.

Sincerely,

Carlos Fernandez

Westville, NJ 08093

Almost every day I see letters in our neighborhood news site asking why our electric bills have increased so much. Many people have difficulty paying their electric bills, as their salaries have not increased! The entire family budget is upset by the large increase. All this, not to directly benefit families, or even possibly indirectly. The extra charges should not be imposed directly on householders or renters. We did not agree to take on this extra burden.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Linda Henson

Haddon Township, NJ 08107

I am a volunteer with the NJ Sierra Club who advocates for clean energy, especially offshore wind and solar. This is an important issue to me!

To the Federal Energy Regulatory Commission (FERC):

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Lisa Gwin

Buena, NJ 08310

To the Federal Energy Regulatory Commission (FERC):

Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Gail Zelenak

East Windsor, NJ 08520

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

Wendy Macauley

Montclair, NJ 07042

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Michael Lebrun

Make technology corporations pay their fair share for the enormous amount of energy they are using!
