We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Joseph Gammaitoni

Scranton, PA 18505

The power grid should be nationalized.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

James Thompson

Erie, PA 16506

People like us who worked their whole lives are being crushed by these bills. They need to pay for their own upgrades. They make the profits, they need to pay for them!

To the Federal Energy Regulatory Commission (FERC):

Kingston, PA 18704

PA. is creating financial pressure on our citizens with the current and future growth of Data Centers in our state. Tax exemptions for major corporation planning to build data centers will also cost Pa citizenns and great a greater deficit for PA which needs to fund important services for our residents: education, transit, social services (given the Federal cuts to Medicaid, health insurance, SNAP, and the list goes on. One estimate is that it will cost the State $25 billion in revenues over an extended period of time. In addition, it is a completely inaccurate that Data Centers increase jobs. Yes, for the building of these Centers and then that's it! There are very few people who actually work at these Centers. Once again, the State is basing it's decision on inaccurate information on economic growth. Some states are prohibiting the Data Centers being built in their states Not PA--we make the same mistaken over and over again e.g. The Cracker Plant in Beaver Valley.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

K Nichols

Levittown, PA 19057

We don't need any data centers- there's not one person I know in our area of Pennsylvania who is for them- we want affordable energy!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Natalie Ferrebee

Mechanicsburg, PA 17055

Sugarloaf, PA 18249

The policy decisions around the growing energy demands from large data centers will have serious impacts for decades to come. Insufficient regulation risks grid instability, rising consumer costs, reliance on high-emission energy sources, and setbacks to state and corporate climate goals. Now is the time to get this right.

To the Federal Energy Regulatory Commission (FERC):

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Louisa Feeley

Downingtown, PA 19335

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Emma Dale

I feel very strongly about the message below. It is not fair to the public to have to pay the costs, both monetary and environmental, associated with extremely wealthy company's insatiable power demands that are going to reap them huge profits. Please read and carefully consider implementing the recommendations. Thank you.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Linda Waldron-Inman

Johnstown, PA 15902

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Sharon Sobzak

Conway, SC 29526

Press these companies to use more clean energy. Don?t place corporations above citizens.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

Franklin, TN 37064

Keeping Tennessee beautiful and prosperous for our people is a major issue for me. Big Tech data centers will make everyday Tennesseeans? lives worse because they will raise our electric bills and risk the security of our grid when we need it most, especially as flooding and heat waves and outages become more common! It is a nightmare to think that this could impact my safety and my finances, and hurt our state?s beautiful environment too. I do NOT believe data centers should be build here- it?s unnecessary, risky, and harmful.

To the Federal Energy Regulatory Commission (FERC):

Gainesboro, TN 38562

Trump gave all these corporations huge tax breaks so why should be as citizens have to pay more for everything else like data centers when they are reaping the rewards. STOP GIVING CORPORATIONS EVERYTHING THAT THEY WANT AND DO NOTHING FOR THE PEOPLE.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Gerald Mackey

Gainesboro, TN 38562

This is a serious matter that is already negatively affecting the voting population, and I hope that doing the right thing for individuals who don?t have billions and power  is supported.

To the Federal Energy Regulatory Commission (FERC):

Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Jon Shefner

Knoxville, TN 37920

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Eidson, TN 37615

As a Texas resident and small business owner, I am deeply concerned about the growing energy demands of large AI data centers and how those costs are being shifted onto everyday citizens. My utility bills continue to rise, and it is troubling to think that residential customers and small businesses may be subsidizing the infrastructure required to power energy-intensive tech expansion.

Reliable and affordable electricity is essential for families, seniors on fixed incomes, and small businesses trying to stay afloat in an already challenging economic environment. If data centers require massive new load additions, transmission upgrades, or reliability backstops, those costs should be borne by the companies driving that demand ? not by ratepayers who had no role in creating it.

I support innovation and technological advancement, but it must be planned responsibly. Grid stability, long-term reliability, and fair cost allocation must come first.

To the Federal Energy Regulatory Commission (FERC):

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Jared Burns

Houston, TX 77062

The Edwards aquifer here in south-central Texas is drying up.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Thomas Wolfsohn

San Marcos, TX 78666

Buda, TX 78610

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Amber Smith

San Antonio, TX 78232

Please don?t let data centers raise our electricity bills.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Kim Bigley

Houston, TX 77009

How about making the utility company pay ALL the costs of the energy usage increases? The rate charged to the data center should only apply to the data center! Why subsidize the corporation by charging home owners and local companies high higher rates that allows data center operators to pay less rather than the full cost of the centers ?

To the Federal Energy Regulatory Commission (FERC):

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Pamela Miller

Tolar, TX 76476

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Stephanie Moya

Spring, TX 77388

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Edward Lenart

Why should the constantly squeezed consumer shoulder, the cost of energy demands for big dick data centers? It is the billionaire owners who are profiting from these structures. Citizens have not asked for nor approved any of these structures. The cost can well be afforded by those who are continuously profiting from their use. Do your job protect the citizens from the cost And the insecurity that comes wit these increased demands for energy depleting what is available for use to private citizens!

Right now, PJM is seeking approval from FERC for how it handles large load additions. Currently, the vast majority of these new large load additions are coming from Big Tech's drive to build out AI data centers. We want smart planning to determine what the future of our electric system looks like, not dystopian futures where families go without electricity to power Big Tech?s data centers.

To the Federal Energy Regulatory Commission (FERC):

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Nadia Diaz

Midland, TX 79701

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Mark Brown

San Antonio, TX 78216

There's an old saying about funding before needed that should be applied to this. Having worked in several government branches have been urged to spend fully the allotment of funds needed or not less you effect next year's budget allotment. Let me first see expenditures that the public will actually count as an improvement to our daily life.

To the Federal Energy Regulatory Commission (FERC):

The cost of living. It is SO high today that the last thing we need is higher electric or utility bills. It's hard enough to buy groceries without having to pay a higher utility bill. To keep them freezing in the winter. More electronic inventions, more builds is not more important than the lives of humans. Also, we need to address how much water is being used in contaminated by electronic plants. This water is contaminated, it can't be reused. Can't be cleaned. It goes to a hazardous waste dump, if we keep going the direction we're going with electronic plants, they will deplete our dround water. Why is nobody talking about that?

Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Daniel Harrison

Hutto, TX 78634

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

Please prioritize clean energy, most particularly on-site geothermal. It has the benefit of being site specific and not requiring the additional infrastructure of electrical transmission. Most importantly it avoids burdening the grid (and the cost to the public) with the additional electrical loads required by data centers.

To the Federal Energy Regulatory Commission (FERC):

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Anne McKeithen

Charlottesville, VA 22902

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

T Morris

Henrico, VA 23233

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Alexis Gilman

McLean, VA 22101

To the Federal Energy Regulatory Commission (FERC):

Roy Yamamoto

Henrico, VA 23233

In my opinion, wasteful data centers should not be issued permits to be constructed or brought online. They do very little to benefit residents in their vicinities and only serve to enrich tech billionaire grifters.

I would suggest legislation that requires any data center to be fully powered by 100% carbon free energy sourced within the county that the data center is located. This would serve to to drive development and innovation in carbon free energy production

To the Federal Energy Regulatory Commission (FERC):

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Janet Rountree

Suffolk, VA 23434

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Rick Miller

Warrenton, VA 83014

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Steve Brown

Lynchburg, VA 24504

I live in Fauquier County , VA, and I am horrified by the pressure to build more and bigger data centers on a daily basis.  We do NOT want these monstrosities and the connected power lines and towers throughout our area.  Additionally, we should NOT be paying the costs to operated them .

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Nancy Premem

Warrenton, VA 20187

Lois Ebey

Alexandria, VA 22307

The average consumer CANNOT afford to pay the load that should be shouldered by the tech companies, companies that will then add to our burden by charging for their services in addition to paying for their energy.  The example building has a lot of space on its roof that could be used to generate solar energy and cover some of its own costs.

To the Federal Energy Regulatory Commission (FERC):

If clean energy of solar, wind, battery and geothermal are good enough to power other countries who are obviously more forward-thinking than the U.S. presently is (China's installed solar capacity is now more than half of the entire world's total!), then we should be turning to that as a world leader. But additionally, neighborhoods and their residents should not be footing any of the the bill for power-hungry data centers. They should manage it themselves with clean energy!

To the Federal Energy Regulatory Commission (FERC):

Sincerely,

Rochelle Feller

Newport News, VA 23608

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Therese Weldon

Midlothian, VA 23113

To the Federal Energy Regulatory Commission (FERC):

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Elizabeth Ketz-Robinson

Alexandria, VA 22308

My electric bill continues to rise. We need to make sure data centers don't make that problem worse. They have to pay their fair share like the rest of us.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Ben Grau

Newport News, VA 23606

Alexandria, VA 22302

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Kenneth Lederman

Hello to you

I appreciate all you do in your job, and I realize it is really difficult to balance all the different perspectives. One perspective that seems to be consistently ignored is that of the residential rate-payer. We are asks to pay more than 50% of the infrastructure costs needed to supply Data Centers with the electricity they need. Why should we pay for it? Without the explosive growth of data centers, electrical needs in the PJM area are relatively flat.

Please consider making them pay for their own infrastructure needs

Thank you,

To the Federal Energy Regulatory Commission (FERC):

The entities that are reaping huge financial profits from data centers should be required to put some of that profit into developing clean energy and waste water recycling to run those data centers. Why not? How many private airplanes do they need? With the billions of dollars being earned, surely there is some to spare for doing things right. If we continue to rely on fossil fuels to power the data centers even as the current administration removes pollution controls, we will be going backwards in time, back to the time when "smog" was a word in daily use.

As discussed below, I think we need to slow down in developing data centers and make sure we aren't sacrificing the good to "get ahead of China" and other countries. We should be aspiring to beat everyone, even if what they do is wrong or destructive. We already see the problems with AI in safety for children, aloong with other addictive websites! More isn't necessarily better, especially whe bad side effects result!

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Nathan Winiarski

Crozet, VA 22932

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Meghan Blydenburgh

Richmond, VA 23224

In VA, we are outraged at what trillion dollar tech companies are doing to our state -- and sticking average people with the bill. Amazon and the Data Center Coalition have lied to us over and over again, withheld information, and corrupted local decision making. DO NOT LET THIS CONTINUE. DO NOT WORSEN IT. DO NOT GIVE THEM INCENTIVES TO SHIFT OVER TO TOXIC AND NOISE BACK-UP GENERATORS AS A SIDE EFFECT OF NEW CO-LOCATION RULES. BECAUSE WE KNOW THAT IS WHERE YOU ARE HEADED. DO NOT DO THIS. IT WILL END UP ON YOUR DOORSTEP AND YOUR CONSCIENCE SOONER RATHER THAN LATER. DATA CENTER COMPANIES ARE THE ROBBER BARONS OF THE 21ST CENTURY. We experienced it first hand in Warrenton VA with Amazon lying, corrupting, and withholding information. We all saw it. It all played out in plain view. Do not ignore the very real experience in Warrenton, Prince William County, and many other VA Counties.

David Herring

Poquoson, VA 23662

Housing is already not affordable for young adults like me. Please don't make those expenses go up more by making us, the people who are directly affected by these data centers, pay the costs for the power that these data centers "require" when the companies who are responsible for building these data centers can more easily provide the money needed. Companies don't need that money to survive, the people do.

To the Federal Energy Regulatory Commission (FERC):

Bill Stewart

Arlington, VA 22207

Data centers are already impacting my old local community. Please don?t let it impact Virginia as a whole!!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Dani Schiff

Richmond, VA 23220

I don't think data center should be built on any land near humanity or nature! I guess I'm saying I'm dead set against it! We have enough already ruining our precious land so far.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

Clarice Dibble

Richmond, VA 23238

Virginia is home to the most data centers in the US with over 600. The problem is that VA constituents had no choice or consent to this. Data centers have been proven to damage water quality and pressure, increase energy bills, and pollute our air and environment. The demand for more jobs is no excuse; remember Phillip Morris? Remember coal mining? These were high demand jobs. Now remember the cost. This is a modern equivalent. We are tired. We have fought and advocated for our workers rights for how long? Use my taxes to fix the benches at Maymont. Give the homeless a mattress to sleep on. Nobody gives a damn about data centers or AI.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Troutville, VA 24175

As a community member I am extremely concerned that the data center build out will take us backward on climate action in Virginia by not requiring these large load installations to be powered by clean energy.  Tech companies are nothing if not innovative, please require them to power data centers in a manner consistent with Virginia greenhouse gas reduction goals and in a manner that ensures Virginians electricity prices don't rise.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Peter Fish

Oak Hill, VA 20171

As a consumer it?s not my responsibility to subsidize the cost of doing business for data centers. These companies can more than afford to pay for their usage and more for the inconvenience to regular households. PJM has stated they will not be able to meet demand for electricity because of the data centers by 2030. Force them to build their own energy sources that feed back into the PJM grid and require they cover 125% of the their usage. You have lost your minds if you believe average households should be paying more for less energy and for a network whose infrastructure is FAILING. Use your power as a monopoly to demand better for your users.

To the Federal Energy Regulatory Commission (FERC):

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Joe Schy

Hampton, VA 23664

The cost of these power data centers should be paid by the companies establishing them. Citizens should have a say before these data centers are built as to whether or not they want them.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

Arlington, VA 22202

Tech companies must foot the bill fo data centers. However, raising our rates  to foot the electrical  bills to fund them is not fair. Those building the centers need to find ways to fund them without making the people of Virginia pay for them. We should not have to pay their electrical bills. I?m worried that they will be prioritizing their use over the small consumers. I am worried that our electricity will become unreliable as demand on the grid increases. Data centers should alone pay for their electricity and find a way to do so using alternate energy sources. We should not have to foot their bill!

To the Federal Energy Regulatory Commission (FERC):

Lenora Thomas

Va Beach, VA 23464

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Mark Campbell

Stanley, VA 22851

People and Nature are not resources for the super rich.  Do not sell us out.

Reston, VA 20190

Look I got a electric bill for $1,197.47 cent's bill , so how do u think I fell and living on a fixed income and all I get is thirty hundred a month. So what I'm I left to do. Know do u think that is right? I ask of u and u want to aloud these companies to come into VA and other States and do what they want. Who pays for this, the little people, that's who. So Fix It. Ty u.

Norfolk, VA 23505

My family and my neighbors are already struggling to pay the bills. I'm worried the sprint to provide enough energy for AI will make my bills higher and my air less clean. I have asthma, so air pollution has a huge impact on my quality of life. On top of that, I want clean air for my kids. Please make sure new energy infrastructure doesn't add pollution to our air or raise our bills - I'm counting on you!

Rebecca Rose

Virginia Beach, VA 23452

I am very concerned about a proposed data center near me. I live in Roanoke and the data center would be in Botetourt County but would use millions of gallons of water daily from Carvins Cove which also provides water for the city of Roanoke. There is little transparency in this process or community input for something that could heavily impact our lives if our water supply is impacted. There is also the issue of energy use. We are likely to see increased water bills and electric bills; this should not be on us but on the data corporations themselves. Additionally we need to know that our water supply is secure since there is much uncertainty about that.

FERC?s regulation of the buildout should include the requirement for these companies to provide clean energy devrlopment for thrir ussge because we know that with all the energy they require the use of fosdil fuels will make climate change far worse!

To the Federal Energy Regulatory Commission (FERC):

Anne Lusby-Denham

Roanoke, VA 24015

I strongly believe that big tech companies should not be allowed to undermine Star clean energy policies, or increase the expense of energy to families. Big data companies must be held accountable for meeting their own energy needs, which, best case scenario, would spark innovation and energy efficiency.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Beth Kuhn

Charlottesville, VA 22901

To the Federal Energy Regulatory Commission (FERC):

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Chris Donaldson

Midlothian, VA 23113

This matters to me because my community should not be subsidizing the cost to power data centers. Please  consider protecting my community.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Lina Al Taii

Falls Church, VA 22042

I?m on a fixed income. I love technoligy as much as the next person. I also love my wilderness and open spaces. Society is getting too big too fast when it comes to technology. I cannot afford a raise in prices as I have nowhere to get income . I don?t want AI to replace human intelligence, not that that is much- look at the evening news. But we are taking this too big too fast. And too expensive.

Robert Rhoads

Reston, VA 20194

Data centers will use huge amounts of electricity and will drive up cost for all of us that live for paycheck to paycheck. From what I understand they also use a lot of water and in my area a lot of people depend on ground water to live and water livestock. The data center representatives won?t tell use where the huge amounts of water will come from or how the wastewater will be disposed. Problems that they cause will just be passed along to the local people and localities. They need to do economic and environmental impact studies and make them public.

To the Federal Energy Regulatory Commission (FERC):

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Judith Sheldon

Sterling, VA 20164

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Patricia Hartmann

Roanoke, VA 24019

Chesapeake, VA 23320

Besides being huge users of water and electricity (which they need to pay for themselves & additionally need to figure how to conserve) why would we expect them to have a lasting need as the tech world figures out how to be smaller?  Additionally, why are they not required to have green robes and green (trees) surrounding them to offset their consumption of once productive land.  There appears to be no long thought of the data Center?s impact and how destructive it is, eventually to us humans.

We were told that sun/wind energy would lower our energy bills and that?s why many changed to using sun/wind energy and geothermal energy would be much cheaper to run out housing needs for lights and heating needs. I never heard anything about data centers and the tremendous amount of energy they required to run. In fact I thought sun and wind and geothermal energy were to replace our need for electricity and would be much cheaper to replace them. Nothing was ever said about data centers. Now that?s all we hear about those needs and the electricity they would take; and then the talk about the possibility of data centers needs and how they might jack up our electricity bills. Cunning way for us to pay a part of their bills and make our reduced bills go up again!!! No Fair if that happens. We didn?t agree to and should not have to pay for the energy costs that they would rack up!!! Let them pay their own bills. They don?t have the right to palm their electric bills off to us!!!

Sincerely,

Malorie Collins

Fredericksburg, VA 22406

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Annette Minnis

Williamsburg, VA 23188

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

melaniejane barnum

Charlottesville, VA 22902

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Caroline Pott

Vienna, VA 22180

Spotsylvania, VA 22551

Too little attention has been paid to rational electric grid development for some yesrs. Now is the time for producers, policymakers and consumers to come to consensus on a rational and economically sustainable plan for addressing current and emergent demands and needs. Transparency and thoughtfulness in the process should feature, as well.

To the Federal Energy Regulatory Commission (FERC):

We, residential folks, already pay our fair share of enery costs. The demands of data centers needs to be put on those who create the technology. Tech companies have decided to create technologies that need data centers so it should be on the data centers to power those systems. Furthermore, that power can easily be generated by renewable energies. Data centers are a huge eye source and take up space that usually was full of greenery, the least that can be done is to offset those centers as much as possible, meaning using renewable energy, adding greenery back into the environment, and reducing the amount of water needed to cool these systems. In a world that is only getting hotter and getting less green and environmental by the day, tech companies, who have contributed significantly to these issues, need to lessen their impact and have a net positive effect on the Earth and its inhabitants.

To the Federal Energy Regulatory Commission (FERC):

PLEASE be ever more mindful of our only planet for our tender lives by either moving for the first time to preservation of them, including our own spirits, hearts, inner & outer health! Even as a teacher before my early retirement from an unresolved hit-?n-run where driver never found after going four times the speed limit on an access road, I had my faithful elementary school students only recycle their paper, plastic in a big black heft bag! At the time, recycling boxes in classrooms did NOT exist so I recycled at my county?s recycling center! Not at all a burden, but a prayer of action AND ones for YOU to respect more your obviously crucial challenges.

I fail to see how AI and Big Tech are improving the lives of the majority of Americans. It?s an industry that uses our precious resources and puts the cost on taxpayers and consumers and at the same time it?s an industry that is working to take over many jobs and careers without a plan for the loss of said jobs. It?s also an industry that uses intellectual property without permission or recognition or compensation. How exactly are AI and Big Tech making life better for anyone other than billionaires?

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Tyler Hernadi

McLean, VA 22102

My electric bill is high enough and I don?t want it to go up again because of data center free usage of electricity that increases my electricity bill

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Terrence Jefferies

Triangle, VA 22172

I do t use AI! I don?t want to pay for their electricity!!

To the Federal Energy Regulatory Commission (FERC):

Virginia Beach, VA 23456

Big Tech data centers are using up our natural resources and then raising our electricity prices. I just got the last bill for over $400 after paying about $35 last year. This is terrible people can?t afford this but these companies can and the price hike is because of them this needs to stop. please take some action and take it soon. Since with this war going on the prices are going to go way up and we already have lost our healthcare. Some people don?t have enough food and most of us don?t make that much money thank you very much.

Virginia Beach, VA 23450

America is the nation most responsible for rapid and dangerous global warming.

FERC must exercise its authority to ensure data centers don?t burn fossil fuels, don?t pollute our air, water and climate, don?t abuse water resources, and have a game plan for decommissioning and recycling their massive amounts of toxic e waste. Americans are not fans of these data centers ? AI promises to put people out of jobs, make more deep fakes and slop and substitute chat bots for people.

I think there should be a moratorium on construction of data centers unless and until they can clean up their act and make the world a better place for people and not increase water scarcity, pollution, environmentally disastrous energy production and infrastructure. Thank you for getting real about this- Earth is our only habitat.

To the Federal Energy Regulatory Commission (FERC):

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Anne Jameson

Marshfield, VT 05658

I don't want my solar energy (that I bought and paid for) credits to go to support the electrical needs of data centers. No one who has responsibly installed solar should have some of that go to a grid that data centers are sponging off of! Let the billionaires who profit hook up their own systems.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Elizabeth Ezerman

Williston, VT 05495

They may not have announced yet but they will.

To the Federal Energy Regulatory Commission (FERC):

Marie-France Imberton

Bellevue, WA 98005

I am a retired computer programmer. I like tech! I look forward to see what people come up with in the future. It is just wrong to allow any business/group/organization to inflict damage on people and say it is acceptable.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Lynn Laverdure

Kent, WA 98030

Cathy Craft

Olympia, WA 98502

Greed about resources surely looks to be the hallmark of big tech & the oligarchy. I just read of national Park land being sold (corruptly) for private residences on land set aside for all life on a different continent. That is ignorance or intent or both. Grow up, big tech! karma is not dismissed by disbelief.

To the Federal Energy Regulatory Commission (FERC):

I Dianne Frothingham

Tacoma, WA 98403

Big Tech under Donald Trump believes that they can unilaterally set the rules and regulations regarding data centers. I believe that should be treated fairly  - meaning they should foot their own bills, they should not be allowed to circumvent a state?s clean energy policies and they should not be allowed to build a bulk energy system which gives them preference at the expense of everyone else.

To the Federal Energy Regulatory Commission (FERC):

Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Kari Darvill-Coate

Sequim, WA 98382

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Bothell, WA 98021

The people don't actually want AI, but it's being forced everywhere by corporations. It's outrageous that their desires to set up data centers wouldn't even be paid by the corporations wanting them and then allowed to impact clean energy policies. The health of our environment and our sanity in not having AI shoved into our lives via digital spaces and now these massive data centers depends on our ability to regulate LLAs and protect our communities. Please do the right thing for the long run and don't succumb to the AI hype.

Unknown, WA 98801

As a worker in the tech industry, I can tell you that a lot of this is not economic infrastructure; it's time-wasting vaporware. Its purpose is to underwrite additional fossil fuel infrastructure because many of the big investors in tech companies are also big investors in oil and gas. I'm hoping my industry crashes in March because of the selfishness and greed of the charlatans who run it. Don't let them take your vital services down with them.

Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Jeffrey Ross

Bainbridge Island, WA 98110

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

The need for electricity will grow rapidly and AI Data centers use a LOT of KWH. Govts. must require them to generate non-GHG electricity that meet all their needs. It may be more encouraging if they can be paid for kwh the add to the grid. A benefit is that producing excess electricity enables them to plan for enlargement, and in the interim they can sell a resource that they control.

Michelle Meyers

Puyallup, WA 98371

We need our government to much more seriously consider how to move forward in clean energy that will meet demands and also that the tech companies using the energy need to be able to pay for its sustainability.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Sara Wagner

Bellevue, WA 98008

Affordable electricity for heating homes MUST be our top priority!

To the Federal Energy Regulatory Commission (FERC):

Everett, WA 98203

I am asking that you do not bend and make provisions for these large AI data centers. Please do not disregard our environment and clean energy policies. The cost and impact of these centers should not fall on the tax payers. These huge tech companies will be the only ones that will financially benefit and the residential taxpayer and environment will be the ones that will suffer. I do not need or want AI and I definitely do not want to suffer the impact of these power hungry data centers. Stop letting the wealthiest people and companies destroy our environment and pushing their own agenda on the taxpayers. I do not want my energy bill or tax money supporting these AI data centers. It has already been proven these operations do not follow the clean energy policies, environmental policies, and have an extremely high impact on the energy grid and natural resources.

To the Federal Energy Regulatory Commission (FERC):

Seattle, WA 98103

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Cornelia Teed

Bellingham, WA 98225

Thank you.

We are building up this AI infrastructure for products nobody wants, that only serve the purpose of a gigantic financial bubble that will eventually leave our economy in ruins, all on the basis of hype for a technology that has yet to show any meaningful practical application. I thus do not want to be told that my country has to build even more fossil fuel power stations in order to power these centers. If tech CEOs want to live in their delusional AI fantasy utopia, then let them, but don't sabotage my future in the process.

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Lenora O'Neill

Toledo, WA 98591

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

While I'm very much supportive of this form letter. I must add that here in West Virginia, besides the unfair added costs, we also face data centers that will generate horrendous and uncontrolled noise and environmental damage in some of our country/ s most natural and undisturbed parks and areas. These centers should impact the (mostly) urban places that will use them, not abuse natural areas with once protected natural areas!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

James Culberson

Morgantown, WV 26505

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Michael McMillian

Slatyfork, WV 26291

Please don't make senior citizens pay even more for electricity when many now have difficulty paying their bills!

To the Federal Energy Regulatory Commission (FERC):

This issue is pertinent to West Virginia. We have too long of a history of letting corporate interests destroy our state, desiccating our forests, and providing little, if any economic benefit to WV. Let?s think forward and bigger picture! Short sighted thinking with only what?s lining the pockets of a few isn?t representative of what?s best for all of us West Virginians. Stop the insanity and take action to stop data centers - in Tucker county especially, but everywhere in WV!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Ruby Jenco

Laramie, WY 83001

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Amy Williams

Ship Bottom, - 08008

Stop demolishing affordability for American citizens! Enough is enough

To the Federal Energy Regulatory Commission (FERC):

Sora, - 03039

Data center loads are having a growing impact both on electricity affordability and negatively impacting our migration to clean energy. Any potential AI benefits are on a path to being overshadowed by negative impacts to our health and climate risks due to expensive and dirty energy choices. Data centers need to pay for the cost increases they are forcing on the system and they need to also move forward with clean and healthy options.

To the Federal Energy Regulatory Commission (FERC):

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Mike Madrid

San pedro, CA 90731

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

Lake Forest, CA 92630

We didn't ask for data centers in our communities. I think it is absolutely ridiculous that communities have to pay for an upgrade to the electricity grid. Charge data centers MORE, make THEM pay for upgrades to the grid and infrastructure. Create legislation that demands that data centers use ONLY clean energy. We don't need data centers!

To the Federal Energy Regulatory Commission (FERC):

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Mary Tom

Parkville, MD 21234

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Tech should be able to pave a direct Pathway to downsize Energy needs, costs, & Best for OUR Earth. Re-inforce THIS with ALL Companies... NOT how much more $$$$$ can they make ! REWARD CORRECT ECONOMIZING.
