We  in South Jersey already have power surges that damage our appliances.  Please do not let these Tech data centers make it worse!!!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Jacquie Amiriantz

Mullica Hill, NJ 08062

To the Federal Energy Regulatory Commission (FERC):

My PSEG bill is thrpugh the roof...outrageous hike in prices...all because of AI...the faimiles and consumers don't give a darn about AI. AI has become a public enemy to many. Why should it be carried on the shoulders of the average consumer...the middle class?!? While AI tech giants line their wallets. If the power companies feel it's fair to bundle costs of Data Fields into their residential customers bills they should be brought to court to answer for it. Let the Zuckerbergs and other billionaires pay for a technology that they operate. AI was forced upon the average citizen/internet user. It is something that we certainly can live without. My electric bill sould not be higher because I have to pay for AI data fields...it is wrong...it is the manipulation of the working class. Let big tech pay for big tech components....Carrie Werner

Verona, NJ 07044

Its hard enough for New Jerseyans to pay their electric bills now, without the data centers. The companies that own them should pay for their own electricity and they should use renewable energy to do it. New Jersey has the potential for geothermal energy, wind energy, solar, and wave-energy. Have them pay for it.

To the Federal Energy Regulatory Commission (FERC):

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Anna Livingston

Tinton Falls, NJ 07764

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Zorina Weber

Montclair, NJ 07042

The American consumer has increasingly been getting screwed to benefit big businesses and corporate interests.  We're not so ignorant or lazy that we won't remember who protected us and who didn't when it comes time to vote in November.

To the Federal Energy Regulatory Commission (FERC):

Alexander Griffin

Ramsey, NJ 07446

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

E D

Unknown, NJ 07086

The internet and social media have allowed unscrupulous individuals to exert an undue influence on society for their own personal gain. AI is a powerful tool and is poised to be the most destructive force on the internet. It is eroding social values and placing young people at risk, including instances where AI has actively encouraged suicide. We need to place the interests of society above those seeking to make huge profits at our expense. We demand that tech companies and developers pay for the costs of new data centers, and not pass it along to residential consumers. Our electrical grid is already strained. If big tech needs massive amounts of energy, make them pay for it.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. - The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Ronald Weiss

West Orange, NJ 07052

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Mihaela Dinu

Freehold, NJ 07728

The building Data Centers is not a hood thing as the money used to build will come from citizens not the big companies who will use most of the energy. So in reality we do not need these data centers. We have done fine before someone thought of this money hungry scheme.  Please do not build!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Caroline Hancock

Princeton, NJ 08540

we don't want more data centers, we want sustainable affordable energy

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

Sincerely,

Taylor McDonal

Mays Landing, NJ 08330

This is one of the most important issues facing our area with respect to environmental justice. And as such it is very important to me!  PJM has been very slow to add in sustainable energy sources and has put financial burden on the residents of our town by the significant increase in the cost of residential energy. Data centers are a huge contributor to this issue significantly increasing the demand which is outpaced supply. There are also some other major environmental concerns surrounding these Mammoth data centers.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Derek Binelli

Linden, NJ 07036

To the Federal Energy Regulatory Commission (FERC):

These Data centers use up too much energy and valuable farmland, pushing up electric and food prices

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Robert Schlatter

Sewell, NJ 08080

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

Vineland, NJ 08361

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Jonathan Hearns

PLAINFIELD, NJ 07060

The site selection and constructing of data centers needs more local and community input and oversight. AI data centers are using too much of our water. AI Data Centers are being built without consideration of the considerable costs imposed on local communities.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

Flagtown, NJ 08821

Our electric bills have gone up a lot already. Data centers in NJ already are a threat to our water supply and steep increases in electric bills. We don't want them here. There's one we're fighting to stop just a few miles from us. Listen to the scientists, environmentalists and economists (the real ones!) on this issue.

To the Federal Energy Regulatory Commission (FERC):

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Marty DuBois

Dunellen, NJ 08812

We should not be paying for private wealthy companies to make money and eliminate jobs. Let them support sustainable development that they pay for instead of helping the Trump admin undermine clean energy projects.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Thom Rule

Little Silver, NJ 07739

Please invest in solar, wind energy

.i do not want new data centers potentially hurting our environmental water resources and raise our bills

To the Federal Energy Regulatory Commission (FERC):

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

steven hughes

Greenwich, NJ 08323

To the Federal Energy Regulatory Commission (FERC):

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Jacquelyn Balasia

Clark, NJ 07066

Tech companies and their owners must step up to pay for their data centers.

Dear FERC,

I am writing to urge you to require Big Tech to foot the bill for their power-hungry data centers and to ensure that data center development does not undermine state clean energy policies or burden families with higher electricity costs.

As a New Jersey resident struggling with high energy bills, I?m alarmed that PJM is planning for massive new energy demands from AI data centers without ensuring these corporations pay their fair share or that families like mine aren?t left with higher bills or unreliable power.

I?ve invested in clean energy for my family because I believe in a future powered by affordable, reliable renewable energy. But now Big Tech is driving massive increases in energy demand that could lock us further into fossil fuel infrastructure. As energy needs increase, irresponsible leadership will continue using it as an excuse to wage wars around the world for oil. If we don?t invest in a grid powered by renewables, we never end this cycle of violence.

To the Federal Energy Regulatory Commission (FERC):

William Foster

Cherry Hill, NJ 08034

Big Tech doesn?t care about communities. People, our shared land, water, and air are nothing more than dollar signs to them. Communities are already standing up and fighting back against greedy corporations proposing senseless development; it?s time for our regulators to stand with us. Big Tech rakes in trillions, and it?s inexcusable that taxpayers are expected to foot their bills.

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Donald Elias

Martinsville, NJ 08836

To the Federal Energy Regulatory Commission (FERC):

We?ve come to far forward to go back to the days where I can remember not being able to see NYC from NJ because of pollution. Millions have been spent on cleaning up all the toxic messes big corporations made. Documentary after documentary film after film made about these things. Don?t know how we possibly ?survived?  without AI. ? sarcasm meant. Stop feeding these data companies off the backs of communities and our natural resources. We?ve One planet and whether or not you believe in god, we?re not getting another one. Just Like a child that breaks its toy. Until you learn to take care of things you?re not getting more.

Don?t rob our future generations of this planet just for greed and instant gratification. It?s time to grow up and seriously think of the best long term future for all of us not just some. Thank you for your time

Holmdel, NJ 07733

These data centers interrupt both humans and animals with their constant noise, bright lights at night, and their need for water that will take too much from aquifers. This water will harm farmers, animals and people as some of the aquifers are already at a low point.

Please reconsider how these data centers are allowed to function and that the surrounding communities need to be informed before they are built.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

JoAnne Kowalski

Bridgeton, NJ 08302

The profit motive is driving this push without proper analysis and discussion.

To the Federal Energy Regulatory Commission (FERC):

Marilyn Graham

Montclair, NJ 07042

No more data centers stop building them. Protect our natural resources.  NEw Jersey should NOT be a Sanctuary State it?s Not good for our family gardens and farms.  Do Not build small housing complexes putting people on top of each other !  Keep people in the Cuty if they want Sidewalks. Concrete is expensive and all the costs are being passed on to the consumer in goods & services.  No more drive up fast food not good for our health.

To the Federal Energy Regulatory Commission (FERC):

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Allan Sauter

Lemitar, NM 87823

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Viki Kirkham

Albuquerque, NM 87105

Our State can?t afford the water.  AI centers, bitcoin creation and drought combine to make a bad situation worse. Please protect our resources

To the Federal Energy Regulatory Commission (FERC):

Michele Brady

Questa, NM 87556

We do live in a finite world after all. Big Tech requires so much water for cooling and produces waste that is difficult to recycle. The Southwest is in drought and we in New Mexico can't afford higher electric bills either. So thank you for your time in reading this and please take my points into consideration.

To the Federal Energy Regulatory Commission (FERC):

Sincerely,

martina sullivan

Santa Fe, NM 87505

NM needs to maintain it's energy independence and protect public utilities. Selling PNM to a company as terrible and massive as Blackstone only provides short term financial incentives to the state while leaving the people of NM vulnerable. Privatizing PNM doesn't serve us, it does quite the opposite. We should be investing in publicly owned utilities in NM to safeguard our communities, lower prices, and create more renewable energy for the state, not selling out to a Wallstreet giant.

To the Federal Energy Regulatory Commission (FERC):

Robin Anderson

Albuquerque, NM 87111

The impact of higher rates is only part of the story. Where I live, in the Southwest US, we say "whiskey is for drinking, water is for fighting". Just ONE hyperscale facility consumes millions of gallons a day - equal to all of the water needed by a medium size town of about 15,000 people. We in the Southwest US don't have enough water for our people, much less to turbo-charge corporate profits. The AI hyperscale facilities energy complex also emit massive quantities of pollutants to air, land, and water, which impact the health of our communities and the environment. These facilities can potentially devastate essential resources for small communities. Please enact protective policies to prevent that. Thank you.

Albuquerque, NM 87110

New Mexico has the lowest per capita income in the nation.  We can not afford to pay more for our energy to support Big AI installations.  Further, we are one of the states most affected by Climate Change and need to use renewable, low-water energy generation to protect against further drought, wildfires, decreasing snow fall, the Rio Grand drying up and general aridification of farm and ranchlands. AI installations generally use lots of water, don't use renewable sources of energy, make environmental conditions worse, and bring increased costs to citizens as state and local communities are left holding the bag to try to remedy their harms.  PLEASE make the make the AI companies pay for their energy use, be environmentally benign, and energy efficient.  Thanks.

Grants, NM 87020

Of course, new technology can be a wonderful thing. But we need to consider the whole impact, not just the convenience or financial gain. It seems like the actual humans whose water supply, environment, and pocket books pay the price for these projects are at the very bottom of the list of considerations (if we are there at all!). I implore you to do the "walk a mile in our moccasins" test as you make your plans. Deeply think about how YOU and YOUR families' lives would be impacted - not just your shareholders. I pray that you will.

To the Federal Energy Regulatory Commission (FERC):

No More data centers

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Lucille Farrington

Los Lunas, NM 87031

Hello,

My name is Laura Rosenfeld. I am a retired college professor and longtime resident of Santa Fe County. During my long teaching career I noticed that the students were becoming more and more depressed and angry regarding the way that large industries in New Mexico have ignored their devestating impact on the land, water and air in their state. The proposed large data centers here - in a region that has suffered decades of severe drought - would add to the un-regulated industrial use of ground water. In a state working hard to limit the effects of oil and gas industry on the environment, they are requiring huge amounts of energy and electricity. PLEASE support SB 235 to protect. our children's future.

Thank You,

- Laura Rosenfeld

Santa Fe County

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Rebecca Kraimer

Las Cruces, NM 88011

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Vern Name

Mesilla Park, NM 88047

Albuquerque, NM 87111

I am completely against Big Tech attempting to take over our state, and threatening to effect our costs, resource and health in their pursuit to use our resources to feed their bloated need for power for their AI world. They must take full responsibility for their needs and actions. They are creating yet another problem for states and the residents that are being forced to pickup the bill for their needs. They are not caring or consulting the people, they are hiding behind a platform and misleading information to get what they want and take resources needed by states for people. Do not approve this mass resources grab by businesses that do not care what they recklessly use and destroy.

To the Federal Energy Regulatory Commission (FERC):

Cedar Crest, NM 87008

Data centers are gigantic, black holes, sucking energy in prodigious amounts. That huge increased usage will end up being SUBSIDIZED by all the other, small customers, like ME & MY FAMILY, because power companies will have to add infrastructure to produce more energy for the insatiable data centers!!

That is the LAST THING the climate, the environment, & we, the customers, need!!!!! These things MUST be heavily regulated, & THEY must bear any added costs! Moreover, the very existence of these power hogs should be questioned, & they should be VERY TIGHTLY REGULATED -- AND THE HIDDEN COSTS IN DAMAGE TO OUR CLIMATE & ENVIRONMENT MUST BE CALCULATED & THE DATA CENTERS & THEIR OWNERS MUST BE MADE TO PAY FOR THAT!!

To the Federal Energy Regulatory Commission (FERC):

Lincoln Draper

Los Ranchos, NM 87107

As a soldier, I was sent to fight for my country. I witnessed massive ecological destruction that still has health and economic consequences for both our troops and local civilians.

New technologies like AI have both promises and risks. AI data centers consume enormous amounts of energy, but there are critical questions about where this energy comes from and who is going to cover the costs.

I strongly believe that those who benefit the most from AI data centers, the corporations that make great wealth from these plants, are responsible for the costs, rather than passing the costs to us. I also strongly believe that the energy should come from renewable sources like solar and wind, rather than using fossil fuels the further pollute our environment and contribute to global warming. We need clear rules and regulations to guide and enforce standards that protect us all. This is the America for which I fought!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Sandra Baack

Las Cruces, NM 88011

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

Santa Fe, NM 87501

Dear Federal Energy Regulatory Commission,

My request to you is that you support we, the consumers vs. large corporate interests.

Corporations need to be the ones paying for enhanced capacity, especially to support AI endeavors, not consumers.

It is important to me, my family, my neighbors that our power grid be reliable, affordable, and fueled by alternatives to coal and gas.

Please do the right thing with your policy impact.

Thank you!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Sanam Keleher

Albuquerque, NM 87104

How much more inflation can Americans take? Energy costs are high  enough right now.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Krista Rudd

Ramah, NM 87321

To the Federal Energy Regulatory Commission (FERC):

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Theodore Desmarais Desmarais

Amargosa Valley, NV 89020

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Danielle Zayac

Reno, NV 89508

Save our energy and communities, please!

To the Federal Energy Regulatory Commission (FERC):

Sincerely,

Mary Bautista

New York, NY 10031

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Elspeth Strang

New York, NY 10025

Karen Konopa

Warwick, NY 10990

Since the establishment last July of an AI data center near us, our electric fees have more than doubled, as have those of our neighbors. It is profoundly unjust to ask middle- and lower-income people to shoulder the financial burden of these data centers. The director of our local human resource center told me that some of her clients have only $1,000 per month in income. An electric bill of $400 has rendered them homeless.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Leah Helmer

Medford, NY 11763

To the Federal Energy Regulatory Commission (FERC):

Dennis Knaack

Bronx, NY 10457

Also, siting SMR (small modular nuclear reactors) at Data centers should be consider as additional options power options. If also connected to the grid these SMRs at data centers could provide electricity back to the grid rather than being cycled up and down as electricity demands change which would benefit nearby communities.

To the Federal Energy Regulatory Commission (FERC):

Bill Reinhardt

Slingerlands, NY 12159

As a Virginia resident and community leader working in civic engagement and equity, I am deeply concerned about the growing impact of large-scale data centers on our power grid and everyday consumers.

In regions like mine, we are already seeing the strain?both environmentally and economically. Our communities should not bear the cost of infrastructure needed to support billion-dollar tech expansion. Working families, seniors, and underserved populations cannot afford higher utility bills driven by corporate demand.

We must prioritize people over profit. That means ensuring that data center developers pay their fair share, protecting state authority to pursue clean energy solutions, and investing in sustainable energy that benefits all?not just a select few.

Energy equity is community equity. I urge FERC to act with transparency, accountability, and fairness so that our grid remains reliable, affordable, and just for everyone.

Evette Barton

Virginia

As AI data centers place unprecedented demand on our power grid, I urge you to ensure PJM?s rules for Large Load Additions protect everyday consumers. The grid must serve communities, not just Big Tech billionaires.

Please enforce these four principles:

Fair Costs: Tech companies and developers must pay for the infrastructure upgrades they require. Residential ratepayers should not subsidize private data centers.

Smart Energy: Meet rising demand with the lowest-cost technologies?specifically clean energy like wind, solar, and battery storage.

State Rights: Do not allow the rush for power to undermine state-level clean energy and climate policies.

Equity: Grid design must prioritize reliability and affordability for residential users, not just large industrial clients.

We are counting on FERC to ensure our energy system remains affordable and reliable for the people.

To the Federal Energy Regulatory Commission (FERC):

Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Edward Wolner

Oberlin, OH 44074

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

C. Thomas Powell

Sagamore Hills, OH 44067

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

As a resident of Union County, it is very frightening to know that not only residents have to be subjected to the light polution, water pollution, we are witness to the destruction of the farmland. I am very sad to know people such as yourself, and city of Marysville city council, had the citizens best interest, had a spine, had integrity, are now only seeing and voting against good values and you are pocketing lots of money. Its seems while you all benefit with your fancy cars, mansions, and vacation homes in tahiti, paid by us lowly taxpayers, middle class workers, and single folks. As if that wasnt sick enough, we are subjected to the same treatment of the former local wildlife. Thanks to you, life as an Ohio farmer is now an endangered species as a citizen we are forced to drink the already poisoned water (look up our union county on the ewg.com) and breath the toxic fertilized air thanks to the fertilizer, and now data centers. I beg of you to please use your brain & STOP AI!

To the Federal Energy Regulatory Commission (FERC):

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Jessica Whipple

Marysville, OH 43040

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Julia Radwany

Akron, OH 44313

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

Sincerely,

Maureen Penman

Columbus, OH 43201

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Deborah Thornton

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Dennis Meaney

Euclid, OH 44123

To the Federal Energy Regulatory Commission (FERC):

Defiance, OH 43512

Wind turbines and solar panels _on_top_ of_ the _AI_centers_themselves,_ and _owned_by them, should provide at least the _vast_majority_ of power for the centers. If they need any more, they should buy it from utilities and co-ops at the _same_rates_as_everyone_else_, perhaps from tightly and properly regulated small modular nuclear reactors and wind and solar farms, _not_ owned by themselves.

A fundamental principle of any decent society is that, to the extent that they can, everyone should pay their own way. But service preference must be given to local residents who have, and whose families have, lived there since before the technology was invented. In a free society, no behemoth should be given power and privileges for more power and privileges at the expense of everyone or anyone else.

To the Federal Energy Regulatory Commission (FERC):

Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Mary Zahler

North Canton, OH 44720

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

Beverly Horsley

East Palestine, OH 44413

How can you possibly consider building a facility in a location to the utilities it needs to run properly. Isn't that putting the horse before the cart? When I built home, I had to put in my water line from the water line to the main line which was about a half mile away. I figured out that I needed the waterline in before I could consider the construction of my new home. No one else helped pay for the installation, even when they wanted to tap into the line. If you need so much energy ,why don't you add solar panels from the start. Then, maybe, you could even sell extra energy that you generate back to the power company! Give to your community, don't just TAKE.

Virtually no citizens want these data centers. The 'leaders' who let them slip through are working against the people, in spite of their needs and demands, and usually in secret. Those people are working quickly and in secret because they know they will be out next election if, hopefully when, the actual American people get their way. I don't want to foot the bill for massive eyesores that serve to print money for robber barons, or to help them surveil Americans. If our tax dollars were really serving us, these data centers would not be going in at all, crypto would be outlawed, and laws would protect skilled workers and their works from being stolen by AI oligarchs.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Kathy Essex

Sandusky, OH 44870

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Elizabeth Anderson

Sharon Grimes

Wooster, OH 44691

PJM's actions have increased costs for residential ratepayers! My electric bill used to be $65-75 in summer & $85-95 in winter. THIS winter, it is very much a different story. Same house, same heating source (fuel oil furnace) and my electric bills were double AND triple! Case in point: Oct 2025 - $66.92, Nov 2025 - $80.38, Dec 2025 - $107.07, Jan 2026 - $144.03, Feb 2026 - $249.71.

I'm scared to see what March's electric bill will be. I'm a single, divorced woman trying to make ends meet in an economy with continually rising costs even with working full-time! I've cut back on groceries to the point of not eating 3 meals a day. I am delaying buying new clothes until my old clothing is full of holes or rendered indecent. I've even delayed essential car repairs until I was able to save enough to pay the costs. Data centers use a large chunk of electric and they should pay for their use just like we residential electrical users do. I can't afford to pay for someone else too!

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Christine Curtis

Rocky River, OH 44116

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Brian Campbell

Delaware, OH 43015

To the Federal Energy Regulatory Commission (FERC):

Columbus, OH 43220

Our small town is up in arms about the Amazon Data Center to be built and located just 250 feet from a residential neighborhood and community elementary. Not only that but the huge tax abatements to locate here and the all of the electric cost changes to the community will very much impact our small community. Anything you can do to keep these large data centers from locating in small town rural America is greatly appreciated. Thank you! ~Kim Law

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Dennis Meaney

EUCLID, OH 44123

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

sydney sher

Columbus, OH 43221

Data centers should provide most or all of their power needs.

To the Federal Energy Regulatory Commission (FERC):

David Lincove

Columbus, OH 43209

When you make these decisions remember your mom and dad, your grandma and grandpa and your children. How are they supposed to pay ther water and electric bills when they are increased to amounts that they cannot afford?  Living on a strict budget will leave many without water or utilizing utilities to the bare minimum. This would lead to illnesses and maybe even death. Please realize that making AI the primary goal for our country is going to cause job loss, depression and realistically loss of so many lives from depression and anxiety.

To the Federal Energy Regulatory Commission (FERC):

Lyndhurst, OH 44124

My energy bills are out of control. I just spent the winter paying over $400/month for my electric bill on a small condo. I didn?t ask for these data centers to be built around Columbus. Nor do I want them here. We were promised that data centers would create jobs and economic opportunity. Yet each center barely has anyone working there and my electric bill is 4x higher than it?s ever been. This is ridiculous. I shouldn?t have to subsidize billion dollar companies. I especially shouldn?t have to subsidize them when they?re doing absolutely nothing for our city and economy.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Canton, OH 44706

Care about the people more than the money!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Connie Fuller

Cincinnati, OH 45244

My home state is Maryland, and I have a deep appreciation and love for the forests and wildlife, as well as the people and programs that were instrumental in developing the person I am today. Electricity and water utility prices are rising, and we have to take action to prevent furthering the devastating living conditions that are being created by these corporations. Vote for quality of life for all. Protect people.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

Sincerely,

Rachael Shefter

Akron, OH 44306

It?s important to me that data centers pay their own way and act as stewards of the community that they are located in. They need to install and pay for electrical equipment/systems. They need to install and pay for water systems that recirculate, not dispose waste into groundwater. If the tech company is self sufficient and sustainable, then the company and its few employees would be welcome to do business.

To the Federal Energy Regulatory Commission (FERC):

Berea, OH 44017

We've got enough problems right now.  Don't make our future worse!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Colleen Colon-Reitsma

Delta, OH 43515

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Why on earth is it the residents responsibility to pay for Big Tech's electric bills??! IF I HAVE TO PAY MY ELECTRIC BILLS!! THEY SHOULD HAVE TO PAY FOR THEIR OWN ELECTRIC BILLS!!! THESE ARE BILLION DOLLAR COMPANIES!! THERE IS NO RESON GOOD ENOUGH FOR REGULAR PEOPLE INCLUDING SENIORS, DISABLED, VETERANS, ETC. TO HAVE T[ PAY FOR THEIRS!! If "Our state governments" decide to pay BIG TECH's utility bills!! Then let the POLITICIANS WHO VOTED FOR THE TO GET BREAKS, LET THE POLITICIANS PAY THOSE BILLS. NOT US!!! ITS REDICULOUS!! MY electric bill has gone up over a hundred dollars a month!! Between these Astronomical bills, extremely high grocery bills, and Now Gasoline bills. Were going to be living UNDER A BRIDGE! After being Totally TAKEN ADVANTAGE of by POLITICIANS and GREEDY CEO'S. POLITICIANS should be MAKING SURE " THE PEOPLE " ARE NOT BEING TAKEN ADVANTAGE OF BY "RUTHLESS CEO'S . When in Actuality "The People" NEED PROTECTED from BOTH!! WE ARE RETIRED HARD WORKING PEOPLE.

Suzanne Vaught

Youngstown, OH 44509

Why on earth is it the residents responsibility to pay for Big Tech's electric bills??! IF I HAVE TO PAY MY ELECTRIC BILLS!! THEY SHOULD HAVE TO PAY FOR THEIR OWN ELECTRIC BILLS!!! THESE ARE BILLION DOLLAR COMPANIES!! THERE IS NO RESON GOOD ENOUGH FOR REGULAR PEOPLE INCLUDING SENIORS, DISABLED, VETERANS, ETC. TO HAVE T[ PAY FOR THEIRS!! If "Our state governments" decide to pay BIG TECH's utility bills!! Then let the POLITICIANS WHO VOTED FOR THE TO GET BREAKS, LET THE POLITICIANS PAY THOSE BILLS. NOT US!!! ITS REDICULOUS!! MY electric bill has gone up over a hundred dollars a month!! Between these Astronomical bills, extremely high grocery bills, and Now Gasoline bills. Were going to be living UNDER A BRIDGE! After being Totally TAKEN ADVANTAGE of by POLITICIANS and GREEDY CEO'S. POLITICIANS should be MAKING SURE " THE PEOPLE " ARE NOT BEING TAKEN ADVANTAGE OF BY "RUTHLESS CEO'S . When in Actuality "The People" NEED PROTECTED from BOTH!! WE ARE RETIRED HARD WORKING PEOPLE.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Suzanne Vaught

We are suffering an unprecedented climate crisis caused by ourselves. If we wish to survive, we must choose only renewable energy. We are also suffering an unprecedented chasm between the wealthiest few and the rest of us, in a world where there has always been a great chasm of wealth inequality. Good government must serve all the human breathing people and cannot be good government when it prioritizes businesses and billionaires over the rest of us.

As a resident of the Midwest and the ?Rustbelt,? I have concerns on how data centers will impact our environment, our energy costs,  and access to clean water. Let?s learn from history and put in place better regulations and laws to avoid more impact to our country. Please regulate the construction of data centers for these stated reasons. Thank you for reading my request.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Heather Supinie

Norman, OK 73071

Tech is always changing, that?s its nature. Why then would we allow something temporary to overtake permanent households, schools and communities? These fly-by-night center will leave nothing but empty promises, chaos and toxic waste in the communities they inflict themselves upon with no gain for anyone but shareholders.

THIS MUST STOP!

Say NO to wasteful, ill-conceived Data Centers that harm more than they will ever help. They?re a waste of resources with a predictable disastrous long term outcome.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Karen Hansson

Salem, OR 97302

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Patricia Pomeroy

Any of these big companies that are the caretakers of all these new data centers being constructed all over the USA should be responsible for paying higher rates for the energy they are consuming. In addition to the grid usage their impact is also affecting our water supplies, air quality, noise pollution, ruining beautiful landscape and buying up premium farmlands at prices that farmers cannot resist to sell at. It is important to make sure that the legislating is strong enough so that big utilities selling the grid energy do not find loopholes to go around the law. This is already happening with the "Power Act" in Oregon

To the Federal Energy Regulatory Commission (FERC):

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Kathy Wilburn

Salem, OR 97306

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Marilyn Costamagna

Big Tech - Data Centers - need to pay for the electricity the use. They are making large demands on water to the expense of the environment. There needs to be regulations on Big Tech - Data Centers - use of energy and water.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

David and Ingrid Cook

Eugene, OR 97405

Residence in Arden have seen their bills for electricity rise more than 60% in the last six years. This increase has strained the resources of many and suggest that further increases are almost certainly in the future many residents struggling to pay their electric bill bills are not in a position to utilize artificial intelligence, but at the same time, they are subsidizing those who use it the most. Having companies that run data centers pay a fair share of their cost is one way to keep the cost of electricity from reaching a point where people will no longer be able to pay for it.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Energy use by huge data centers creates economic and resource problems wherever they are set up. This kind of centralization of power usage is simply not sustainable or desireable. Big Tech needs to establish their own power sources (preferable solar or wind) rather than burdening a power grid meant to support and sustain human life.

To the Federal Energy Regulatory Commission (FERC):

Medford, OR 97504

The energy grid has to deal with the increased demands of the new data centers. Please assure that the cost for this is actually paid by the power centers and not shouldered by the consumers. These companies are massive and consumers eventually pay them for the product they sell, but they should not also bear the burden of the energy upgrades by paying higher prices. Protect our energy prices.

To the Federal Energy Regulatory Commission (FERC):

Norman Lewis

Eugene, OR 97405

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Jennifer Abernathy

La Pine, OR 97739

Colton, OR 97017

Tech companies like Microsoft, Amazon, Alphabet, Meta, Nvidia, and OpenAI are spending hundreds of billions to build data centers. They also collectively have trillions of dollars of market capitalization. They do not share their profits with average citizens. Average citizens should NOT have to foot

their enormous electric bills. These are some

of the biggest and most profitable companies in the world. They MUST pay for their

own electricity and infrastructure. Do not let that cost be passed on to the average consumer.

To the Federal Energy Regulatory Commission (FERC):

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

linda jones

Patricia Urban

Wallingford, PA 19086

It is unimaginable that you would not place the onus of the energy needs on the companies who are building the data centers and hoping to profit from them. The residential users should not have to b e burdened by the need for this tremendous amount of energy - prices should not rise for them as a result of increased demand. Furthermore, no detrimental effects to the environment should be allowed to accrue as a result of the need for the energy by these data centers. It should be made clear to the data centers that they need to pay all the usual hidden environmental costs. These are the obvious stipulations that a conservative would take to allow for the development of these energy eating edifices!

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

John Ramirez

Paoli, PA 19301

Massive resource drain will NOT benefit local communities. Profit will go to a few distant, probably tax free huge corporations.

To the Federal Energy Regulatory Commission (FERC):

Louise Hartman

Mount Carmel, PA 17851

As an 83-year-old resident of a retirement community in Pennsylvania, I see the real costs of unchecked energy demand. Our facility's operating costs rise considerably annually, increases passed directly to residents on fixed incomes. Beyond utility bills, modern life now requires paid subscriptions to AI platforms, telecommunications, creative software, and cloud services ? all energy-intensive. These fees are unavoidable and rising. I have spent 30+ years in global health education, working to ensure equitable access to essential services worldwide. The same equity principle applies here: our power grid is a shared public resource. FERC must ensure that Big Tech's insatiable appetite for electricity does not come at the expense of elderly, low-income, and fixed-income households who bear these costs indirectly but unmistakably. Smart, evidence-based grid planning that prioritizes clean energy and consumer protection is not optional ? it is a moral and economic imperative.

To the Federal Energy Regulatory Commission (FERC):

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Reinhild Drägermünke

Bala Cynwyd, PA 19004

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Robert M Goodman

Mechanicsburg, PA 17050

The Super-Rich have shown that they have no integrity and can't be trusted. Therefore, this former Republican and Libertarian says, "Eat the Rich. We are sick of socialism for the wealthy and capitalism for the rest of us. STOP SUCKING OFF TAXPAYER TEAT, YOU RICH SWINE AND CORPORATE INTERESTS!!

To the Federal Energy Regulatory Commission (FERC):

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Christina Criss

Chadds Ford, PA 19317

Although I am not against development of data  centers, I believe residential electric customers should not bear the increase in electric costs caused by these centers. The data centers should pay!  The four principles in this message are excellent.  An additional point:  While our power system is facing unprecedented demand, are we taking steps to secure the grid against enemy sabotage?

To the Federal Energy Regulatory Commission (FERC):

Willow Grove, PA 19090

Any organization that uses and demands electric must pay the same prices as residential and commercial customers. Not some special price because the buyin bulk . Actually if they buy in bulk they should be charged more for electric because of the demands that puts on the electric supplier. .25 to .30 per kilowatt seems about right and not a Penny less!

Wellsboro, PA 16901

We are putting AI above human life! So many of us cannot afford the utility bills we are currently experiencing. Telling us to "lower the temperature" doesn't work. We are struggling with low heat settings already. People's lives are more important the AI. We can save both if we really try.

Please protect our environment and the public safety as the highest priority! Please require tech companies and developers to pay for data centers, not the residential rate payers. PA has been doing a great job over all protecting our citizenry, please make decisions that are in the best interest of the general public, not big corporations with their well heeled lobbyists solely focused on making money at all costs. Please use sustainable resources whenever possible and make decisions like your children live in the neighborhoods surrounding these sites. The environmental impact of these data centers is enormous, and the costs to the neighboring communities are staggering, financial costs and also the cost of losing their community as they?ve know them to be. Residents need to be compensated for the negative impact of the development of data centers, not penalized by having to pay exponentially more for electricity while losing so much of what makes their community their home.

To the Federal Energy Regulatory Commission (FERC):

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Gary Snyderman

Holland, PA 18966

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Michael Dadamo

Dear FERC Commissioners, I am writing to demand you take immediate action to protect residential ratepayers from surging electricity bills driven by, and and artificial intelligence data centers. The massive power demand from these facilities is straining our grid and forcing average families to pick up the tab for infrastructure upgrades. I urge you to require data centers to pay for their own infrastructure costs and to ensure grid reliability is not compromised for the sake of Big Tech expansion.

To the Federal Energy Regulatory Commission (FERC):

Helene Rosen

Ivyland, PA 18974

My electric supply cost rose over 35% this year.  Time to let the EXISTING customers have a say.  All large users need to pay 100% of any infrastructure improvement costs as well as a usage charge that leaves the existing customers neutral or better.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Marion Friedman

Elverson, PA 19520

To the Federal Energy Regulatory Commission (FERC):

In my area the electric is already under stress. I own a grocery store and in 2025 the electric was off 3 times for more than 12 hours. In 15 years of business it has never been off more than 3 times. There are more homes going up and more large chicken houses that are all putting a strain of the electric grid. Putting an AI facility in our area would be very detrimental to the people that live here.

To the Federal Energy Regulatory Commission (FERC):

Seth Gummo

Bellefonte, PA 16823

Please take this communication under serious consideration and do not pass along the cost of data centers to residential ratepayers.  Thses costs should be borne by the tech companies and developers who benefit from them.

Thank you for your attention to this important matter, whose far-reaching consequences will place undue burdens on residential consumers.

Rosemary Slegel

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Rosemary Slegel

Trexlertown, PA 18087

We need to protect our environment and communities and planets

To the Federal Energy Regulatory Commission (FERC):

Betsy Levy

Wynnewood, PA 19096

Data Centers should, if they're permitted at all, be required to avoid antiquated electric generation that contributes to greenhouse gas emissions and environmental damage from fossil fuel extraction. It is amusing to hear the claims for the futuristic nature of AI (and the replacement of workers with robots and other "high tech" gadgets) and for those same "advanced" technologies to be powered at public or taxpayer expense to avoid the AI industries actually paying for both the economic and environmental costs of their "futuristic technologies" that should be so "valuable" that the energy and environmental costs should be easy for these technologies to "pay for themselves" and not be subsidized by citizens and utility ratepayers.

To the Federal Energy Regulatory Commission (FERC):

Our electricity bills have more than doubled to pay for electricity for the proposed data centers we don't want in our community. They are not generating their own power or using clean energy. They plan to consume our water and energy and pollute our environment. If they can't follow safe and clean policies and pay for their own energy, we don't want them. We are fighting them in Lehigh County, Pennsylvania.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Sincerely,

Yvette Kuhns

Orefield, PA 18069

I have grave concerns for my quality of life as well as that of my children and future generations as more of our resources are depleted to serve the interests of big business. I'm this country there is a mentality that all resources such as clean water, clean air and electricity are infinite in supply. We all know that is not true. I know what it is like to have electrical grids that cannot support utilization and need. We need assurance that these electricity drains become self-sustaining so as not to impact the daily lives of ordinary citizens.

To the Federal Energy Regulatory Commission (FERC):

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Shirley Sword

Harrisburg, PA 17111

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

Canonsburg, PA 15317

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Robin Mcfall

Hermitage, PA 16148

To the Federal Energy Regulatory Commission (FERC):

AI Data Centers require exceptional resources and energy use. They should not be subsidized by families and ordinary citizens, small businesses, etc. They already use our personal and online data for profit without permission. It's time Big Data was prevented from taking advantage of citizens. They must pay for the costs they create and not jaise the bills of all other users, whether it be costs of electricity, water, or environmental problems these data centers create.

To the Federal Energy Regulatory Commission (FERC):

Edinboro, PA 16412

I want the Commission to consider BOTH the cost to consumers to allow these behemoths, and the damage to the environment caused by them. The promise of a few jobs does not outweigh the negative impacts. Plus, giving huge tax breaks to them is not in the best interest of the community when budgets are already strained.

The AI is important to me but not at the expense of impacting the health of communities.

To the Federal Energy Regulatory Commission (FERC):

Artificial intelligence data centers are placing unprecedented new demands on our bulk power system. Electric consumers across the country are counting on FERC to work with PJM and other Regional Transmission Organizations to ensure grid reliability and affordability in ways that won't compromise our environment and communities.

As FERC considers PJM's proposal for handling large load additions (LLA) like data centers, it should be guided by four principles to protect consumers and our communities:

- The costs to power data centers should be paid for by tech companies and developers, not residential ratepayers.

- Lowest-cost energy technologies (often clean energy like solar, wind, battery power, and geothermal) should be encouraged to match rising electric demand and ensure grid reliability.

- State rights to pursue clean energy policies, especially around climate and clean energy, should not be undermined in the rush to power data centers.

- Electric system design should not give preference to larger industrial users like data centers at the expense of residential and other consumers, including small residential consumers typically underrepresented in decision-making.

We need FERC and PJM to make it clear that our power grids are meant to serve everyday people and our communities, not just Big Tech billionaires.

Sincerely,

Mehdi Entezari

Electric rate payers want big tech to pay for data center development and power.
