Climate Justice Coalition Announces Proposed Climate Goals
For San Antonio’s Public Utility CPS Energy

SAN ANTONIO, Texas - Today, a few days after the one-year anniversary of President Trump announcing US withdrawal from the Paris Agreement, the Climate Action SA coalition called on the City of San Antonio to establish significant goals to help San Antonio fight climate change.

Climate Action SA proposed the following goals for CPS Energy, our city-owned public utility: CPS Energy electric generation Coal-Free by 2025 and Carbon-Free (no fossil fuels) by 2030. Significant reduction in the reliance on fossil fuels can be achieved with aggressive investment in energy efficiency, demand response, renewable energy and energy storage.

These goals for CPS Energy put the city on a path to achieve of a goal proposed by Climate Action SA for city-wide greenhouse gas emissions to be reduced to net-negative by 2050 or sooner, following a path that prioritizes near-term reductions. Net-negative means that community activities would pull more greenhouse gases out of the atmosphere than they emit into it. This is assumed by almost all of the climate models used in the development of the Paris Climate Agreement.

“The climate community in San Antonio is taking the right step towards including the neighborhoods most affected and creating solutions that are just, resilient, and keep the ecosystem of neighborhoods strong,” says Diana Lopez of Southwest Workers Union. “We are taking this beyond the Paris Climate Agreement and localizing action in San Antonio.”
The public health benefits of phasing out fossil fuels are well known. In addition to releasing carbon pollution which leads to climate change, coal and fracked gas produce pollution that creates ozone (smog) and particulate matter (fine soot), impacting vulnerable populations here at home the hardest.

“San Antonio is now failing federal air quality standards for ozone,” points out Peter Bella of imagineSanAntonio. “We insist on reductions in both carbon- and ozone-causing pollution, and SA Climate Ready provides the path.”

San Antonio can be a leader, but we don’t have to do it alone. Cities around the world are taking action to address climate change. The goals supported by the Climate Action SA coalition are necessary to avoid the worst of climate change and reflect the commitments in the resolution passed last June by Mayor Nirenberg and the San Antonio City Council to support the Paris Climate Agreement.

Keeping global temperature rise to between 1.5 and 2 degrees Celsius requires massive greenhouse gas reductions in the coming decade. The good news is that this transformation not only reduces local air pollution - it will also create new jobs and tax revenues.

“Climate change is an existential threat and what we do in the next couple of decades will determine the fate of billions of people and future generations,” says Briauna Barrera of Public
“We need to ground ourselves in urgency. We need to be compelled into rapid, collective action to preserve a livable planet.”

Although ending our reliance on fossil fuels for power generation is key to solving the climate crisis, we must also be moving aggressively in other areas like transportation and solid waste. The coalition also plans to make recommendations on these topics soon.

The Climate Action SA coalition consists of 35 nonprofit organizations working together to support the creation and implementation of a robust climate action and adaptation plan for San Antonio, developed and implemented with strong community engagement. The coalition has a strong focus on protecting San Antonio’s most vulnerable communities from extreme weather and pollution, and ensuring that all members of the community can benefit from climate solutions.
